

1. Create and Maintain Notification Definitions

As a Nimbus Super User, I want to create and maintain standardized Notification Definitions, so that new notifications can be introduced consistently without redesigning the framework each time.

Preconditions

• User has permission to administer Notification Definitions.

• The Notification Service has been configured in Salesforce.

Business Requirements

BR1: Notification Definitions must be stored centrally in Salesforce.

BR2: A Notification Definition must capture what is sent, what triggers it, who receives it and through which delivery channel.

BR3: The definition must support both Automatic and Manual notification types.

BR4: The definition must support Nimbus Bell, Email or both as delivery channels.

BR5: The definition must identify the source Nimbus application or global Nimbus context.

BR6: The definition must identify whether the notification is Optional or Mandatory.

BR7: The definition must be reusable across different Nimbus applications

BR8: The actual business notification content will be defined separately by Product Owners after the framework is implemented.

Acceptance Criteria

AC1

Given an administrator creates a new Notification Definition

When the definition is saved

Then all required configuration is stored centrally.

AC2

Given a new business notification is required

When the Product Owner provides a completed Notification Definition

Then the definition can be implemented without changing the overall Notification Service design.

AC3

Given an existing Notification Definition needs to change

When an authorized administrator updates it

Then the updated definition is used for future notification processing.

AC4

Given a required field in the Notification Definition is missing

When the administrator attempts to save the definition

Then the definition is not saved.

And a clear validation message identifies the missing information.

AC5

Given a Notification Definition is configured as Automatic or Manual

When the definition is retrieved for processing

Then the configured notification type is available to the Notification Service.

AC6

Given a Notification Definition specifies Bell, Email or both

When the definition is retrieved for delivery

Then the configured delivery channel selection is available to the Notification Service.

AC7

Given an email notification has a translation for the recipient's Contact profile language

When the email notification is generated

Then the email title and message body are delivered in the recipient's Contact profile language.

AC8

Given a Nimbus Bell notification supports the user's selected site language

When the user changes the Nimbus site language and the site refreshes

Then the Notification Center displays the supported notification content in the newly selected site language.

AC9

Given no translation is configured for the applicable language

When the notification is displayed or delivered

Then the title and message body fall back to English.

AC10

Given a translated notification contains a configured Target URL

When the user opens the notification in a supported language

Then the Target URL remains unchanged and directs the user to the configured Nimbus destination.
