Nimbus Custom Notification: 2026-08-06 11:26

As a Nimbus Product Team, I want each Notification Definition to specify its delivery channels, so that notifications can be delivered through Nimbus, email or both.

Preconditions

• A valid Notification Definition exists.

• Eligible recipients have been identified.

Business Requirements

BR1: MVP delivery channels are Nimbus In-App Notification and Email.

BR2: A Notification Definition may use In-App only, Email only or both.

BR3: Bell notifications must use the Nimbus/Salesforce notification capability.

BR4: Email delivery must be processed as part of the same Notification Definition rather than requiring a separate business definition.

BR5: Where a Target URL is provided, the Bell notification and email should direct the user to the relevant Nimbus location.

BR6: Delivery must respect the recipient's saved preferences for optional notifications.

BR7: Mandatory notification rules must override optional preference controls where applicable.

BR8: SMS, native mobile push and Color-specific delivery are outside the current MVP scope.

Acceptance Criteria

AC1

Given Bell is configured as a delivery channel

When a notification is generated

Then the eligible user receives the notification through the Nimbus bell.

AC2

Given Email is configured as a delivery channel

When a notification is generated

Then the eligible user's email channel is used.

AC3

Given both Bell and Email are configured

When a notification is generated

Then both delivery methods are processed for the eligible user.

AC4

Given Bell only is configured

When the notification is generated

Then no email is sent for that Notification Definition.

AC5

Given Email only is configured

When the notification is generated

Then no Bell notification is created for that Notification Definition.

AC6

Given a Target URL is configured

When the user selects the Bell notification or applicable email link

Then the user is directed to the configured Nimbus destination, subject to their access permissions.

AC7

Given an email notification has a translation for the recipient's Contact profile language

When the email notification is generated

Then the email title and message body are delivered in the recipient's Contact profile language.

AC8

Given a Nimbus Bell notification supports the user's selected site language

When the user changes the Nimbus site language and the site refreshes

Then the Notification Center displays the supported notification content in the newly selected site language.

AC9

Given no translation is configured for the applicable language

When the notification is displayed or delivered

Then the title and message body fall back to English.

AC10

Given a translated notification contains a configured Target URL

When the user opens the notification in a supported language

Then the Target URL remains unchanged and directs the user to the configured Nimbus destination.
