6. Support multiple languages for notifications

As a Nimbus user,

I want email and in-app notifications to be provided in the language applicable to me,

so that I can clearly understand the notification content and any actions I am expected to take.

Assumptions:

Product Team would follow the standard business translation process.

Functional Requirements

FR 1: Email notifications must be generated and delivered in the recipient Contact's Preferred Language.

FR 2: The Contact's Preferred Language must be determined separately for each recipient when an email notification is generated.

FR 3: In-app notifications must be displayed in the user's currently selected Nimbus site language.

FR 4: In-app notification language must reflect the Nimbus site language applicable when the notification is displayed.

FR 5: If a translation is unavailable in the required language, the complete notification must fall back to English.

FR 6: If the Contact's Preferred Language is blank, invalid or unsupported, the email notification must be delivered in English.

FR 7: If the selected Nimbus site language is unsupported for a particular in-app notification, that notification must be displayed in English.

FR 8: The language fallback must apply to all user-facing notification content, including:

- Notification title
- Notification message
- Email subject
- Email body
- Buttons
- Links and action labels
- Supporting text
- Other custom labels

FR 9: All translatable notification content and custom labels must follow the standard development translation process.

FR 10: English must be used as the source language and the default fallback language.

FR 11: All parts of a notification must be displayed in the same language. Nimbus must not combine translated and untranslated content within one notification unless the content is dynamic data that must remain unchanged.

FR 12: Dynamic values such as customer names, order numbers, case numbers, product names and other record-specific data must not be translated.

FR 13: The absence of a translation must not prevent an otherwise valid notification from being generated, delivered or displayed.

FR 14: The language requirements must apply consistently to all notification types and applications supported by the Nimbus Notification Center.
