8. Create Notification Groupings

Configure Notification Groupings and Notifications

User Story

As a Nimbus Product Owner,

I want to configure Notification Groupings separately from individual Notifications,

so that preference rules apply consistently to related notifications.

Business Requirements

BR1: The solution must provide separate templates for Notification Groupings and individual Notifications.

BR2: The Notification Grouping Template must capture the Grouping Name, Source Application, description and Preference Type.

BR3: Preference Type must be configured as Optional or Mandatory at the Grouping level.

BR4: Multiple individual Notifications may belong to the same Grouping.

BR5: Every Notification must reference one Grouping and inherit its Preference Type. Preference Type cannot be overridden at the Notification level.

BR6: Mandatory Groupings must not appear in User Preference Settings because users cannot opt out of them.

BR7: Optional Groupings must appear in User Preference Settings and the saved user preference must apply to all Notifications assigned to the Grouping.

Acceptance Criteria

AC1

Given a Notification Grouping is created

When its configuration is saved

Then its Source Application and Preference Type are stored centrally.

AC2

Given an individual Notification is created

When its configuration is saved

Then it must reference a valid Notification Grouping.

AC3

Given multiple Notifications belong to the same Grouping

When they are processed

Then they inherit the Preference Type configured for that Grouping.

AC4

Given a Grouping is Mandatory

When the user opens User Preference Settings

Then the Grouping is not displayed and cannot be disabled.

AC5

Given a Grouping is Optional

When the user changes and saves its preference

Then the preference applies to all Notifications assigned to that Grouping.
